Core Biochemical Pathways and Their Clinical Relevance

The foundation of Biochemistry with Clinical Correlations rests on a comprehensive presentation of major biochemical pathways, including carbohydrate, lipid, amino acid, nucleic acid, and energy metabolism. Each pathway is intertwined with potential clinical implications when disrupted.

Carbohydrate Metabolism

Carbohydrate metabolism encompasses glycolysis, gluconeogenesis, glycogen metabolism, and the pentose phosphate pathway. These pathways regulate blood glucose levels and provide energy for cellular functions.

Clinical Correlation: Diabetes Mellitus: Dysregulation of insulin and glucagon impacts glycolysis and gluconeogenesis, leading to hyperglycemia. The textbook discusses how impaired glucose uptake and utilization underpin both type 1 and type 2 diabetes, with emphasis on the biochemical basis for diagnostic markers such as HbA1c.

Glycogen Storage Diseases: Deficiencies of enzymes like glycogen phosphorylase or debranching enzyme result in abnormal glycogen accumulation, causing hepatomegaly and hypoglycemia. The 7th edition details these disorders, highlighting their biochemical signatures and clinical presentations.

Lipid Metabolism

Lipid pathways include fatty acid oxidation, synthesis, cholesterol metabolism, and lipoprotein transport.

Clinical Correlation: Atherosclerosis: The imbalance in lipoprotein levels, especially LDL and HDL, influences plaque formation. The book explains the biochemical composition of these lipoproteins and how their dysregulation contributes to cardiovascular disease.

Lipid Storage Diseases: Disorders such as Gaucher's and Niemann-Pick involve defective lysosomal enzymes leading to lipid accumulation, with detailed pathways elucidating their pathogenesis.
