Objective questions in thermal engineering are predominantly of the multiple-choice type but may also include true/false, match-the-following, or assertion-reason questions. Understanding their structure is crucial for effective preparation.

#### Multiple-Choice Questions (MCQs)

MCQs are the most common form, presenting a question followed by four or five options, with only one correct answer. They test knowledge, application, and sometimes, analytical skills.

**Example:** In a Carnot cycle, the efficiency depends on:

- The absolute temperature of the hot reservoir only
- The absolute temperature of the cold reservoir only
- Both hot and cold reservoir temperatures
- The specific heat of the working fluid

**Correct Answer:** c) Both hot and cold reservoir temperatures

#### True/False Questions

These assess the candidate's understanding of basic principles or statements.

**Example:** The thermal efficiency of a Carnot engine is always less than 100%.

**Answer:** True

#### Match-the-Following

This format links concepts or formulas with their descriptions or applications, enhancing associative learning.

**Example:** Match the thermodynamic cycles with their typical applications.

| Cycles              | Applications     |
|---------------------|------------------|
| Rankine             | Power plants     |
| Refrigeration cycle | Air conditioning |

#### Assertion-Reason Questions

These combine two statements, where the candidate must determine their correctness and relationship.

**Example:** Assertion: The efficiency of a Carnot engine depends on the temperature difference between the reservoirs. Reason: Greater temperature differences result in higher engine efficiencies.

**Answer:** Both assertion and reason are correct; reason correctly explains the assertion.
