Common VTU Engineering Physics Viva Questions with Answers

1. What is the principle of conservation of energy? Explain with an example.

The principle of conservation of energy states that energy cannot be created or destroyed; it can only be transformed from one form to another. For example, in a pendulum, potential energy at the highest point converts into kinetic energy at the lowest point, and

vice versa, but the total mechanical energy remains constant (ignoring losses).

2. Define velocity and acceleration. How are they related in uniform acceleration? Velocity is the rate of change of displacement with respect to time, expressed as $v = ds/dt$. Acceleration is the rate of change of velocity with respect to time, given by $a = dv/dt$. In uniform acceleration, the acceleration remains constant, and velocity changes linearly with time: $v = u + at$, where u is initial velocity.

3. Explain the second law of thermodynamics. The second law of thermodynamics states that in any natural process, the total entropy of an isolated system always increases or remains constant; it never decreases. This law explains the irreversibility of real processes and the direction of heat transfer from hot to cold bodies.

4. What is interference of light? Describe Young's double-slit experiment. Interference of light occurs when two or more coherent light waves superimpose to produce regions of constructive (bright fringes) and destructive interference (dark fringes). Young's double-slit experiment demonstrated this phenomenon, where coherent light passing through two slits creates an interference pattern on a screen, confirming the wave nature of light.

5. Define wavelength and frequency. How are they related? Wavelength (λ) is the distance between successive crests or troughs of a wave. Frequency (f) is the number of wave cycles passing a point per second. They are related by the wave equation: $v = f\lambda$, where v is the wave velocity.

6. What is quantum physics? Briefly explain the concept of wave-particle duality. Quantum physics studies phenomena at atomic and subatomic scales, where classical physics fails. Wave-particle duality is a fundamental concept stating that particles like electrons exhibit both wave-like and particle-like behavior depending on the experiment conducted, as demonstrated by phenomena such as electron diffraction.

7. Describe the photoelectric effect. The photoelectric effect occurs when photons incident on a metal surface eject electrons from it. The kinetic energy of ejected electrons depends on the photon energy and the work function of the metal. Einstein explained this effect using the quantum hypothesis, which earned him the Nobel Prize.

8. What is the difference between conductors, insulators, and semiconductors? Conductors: Materials that allow free flow of electrons, e.g., copper, silver. Insulators: Materials that resist electron flow, e.g., rubber, glass. Semiconductors: Materials with conductivity between conductors and insulators, e.g., silicon, germanium.

9. Explain the concept of atomic nucleus and its structure. The atomic nucleus is the small, dense region at the center of an atom, composed of protons and neutrons, collectively called nucleons. Protons carry positive charge, neutrons are neutral, and the nucleus is held together by strong nuclear forces. The number of protons defines the element, while neutrons influence isotopic variations.

10. What are semiconductors and their applications? Semiconductors are materials with electrical conductivity between conductors and insulators. They are fundamental in electronic devices like diodes, transistors, and integrated circuits. Applications include computers, smartphones, solar cells, and sensors.

Sample VTU Engineering Physics Viva Questions with Answers

Below is a curated list of frequently asked questions divided by topic, along with detailed answers to aid students' preparation.

1. Wave Optics

Q1. What is the principle of Huygens' wave theory?

Answer: Huygens' principle states that every point on a wavefront acts as a secondary source of wavelets that spread out in the forward direction at the speed of light. The new wavefront is the tangent to these secondary wavelets. This principle explains phenomena like diffraction and

interference in wave optics by considering every point on a wavefront as a source of spherical wavelets, leading to the understanding of how waves bend and interfere.

Q2. Derive the condition for constructive interference in Young's double slit experiment.

Answer: In Young's experiment, the condition for constructive interference occurs when the path difference Δ between the two waves is an integral multiple of the wavelength λ : $\Delta = n\lambda, \quad n=0,1,2,\dots$

Considering the geometry, if the slit separation is 'd' and the point of observation is at a distance 'L', then the fringe width 'x' (distance between successive bright fringes) is given by: $\Delta x = \frac{\lambda L}{d}$

This condition ensures that the waves arriving at a point are in phase, resulting in bright fringes.

Features: Simple derivation based on path difference. Fundamental for understanding interference patterns.

2. Quantum Mechanics

Q3. What is the de Broglie wavelength? Derive its expression.

Answer: The de Broglie wavelength (λ) signifies the wave nature of matter particles. Louis de Broglie proposed that particles such as electrons exhibit wave properties characterized by: $\lambda = \frac{h}{p}$ where: (h) is Planck's constant ($6.626 \times 10^{-34} \text{ Js}$), (p) is the momentum of the particle ($p=mv$) for classical particles).

Derivation: De Broglie hypothesized that matter waves have a wavelength inversely proportional to momentum, analogous to the wave nature of light. This was confirmed experimentally via electron diffraction experiments, establishing the wave-particle duality concept.

Features: Bridges classical and quantum physics. Fundamental for understanding electron diffraction.

3. Semiconductor Physics

Q4. Explain the difference between intrinsic and extrinsic semiconductors.

Answer: Intrinsic Semiconductors: Pure semiconductors without any significant impurities. Their electrical properties depend solely on the material itself. The number of electrons in the conduction band equals the number of holes in the valence band.

Extrinsic Semiconductors: Semiconductors doped with impurities to modify their electrical properties. Doping introduces additional free electrons (n-type) or holes (p-type), significantly increasing conductivity.

Feature	Intrinsic Semiconductor	Extrinsic Semiconductor
Conductivity	Low	Higher
Impurities	None	Doped (donors or acceptors)
Charge carriers	Electrons and holes in equal number	Dominated by majority carriers (electrons or holes)

Importance: Doping is crucial for designing electronic devices like diodes and transistors.

4. Laser Physics

Q5. What is population inversion? Why is it essential for laser action?

Answer: Population inversion refers to a state where the number of atoms or molecules in an excited energy level exceeds those in a lower energy level. This condition is essential because: It allows stimulated emission to dominate over absorption. Enables the amplification of light through stimulated emission, leading to laser action. Without population inversion, the medium would primarily absorb photons rather than emit them coherently.

Features: Achieved through pumping mechanisms (optical, electrical). Critical for sustaining laser oscillation.

5. Modern Physics Concepts

Q6. Describe the photoelectric effect and its significance.

Answer: The photoelectric effect occurs when photons incident on a metal surface eject electrons if the photon energy exceeds the work function (ϕ) of the metal. The key observations are: No electrons are emitted if photon energy ($E=hf$) is less than (ϕ). The kinetic energy of emitted electrons is ($KE = hf - \phi$). The effect depends on the frequency, not intensity, of incident light.

Significance: It provided evidence for the quantization of energy, supporting Einstein's hypothesis of photons, and was pivotal in establishing quantum theory.
