Ticks (Order: Ixodida) Transmit Lyme disease, Rocky Mountain spotted fever, and other rickettsial diseases. Attached for extended periods; habitat management is crucial.

Mechanisms of Disease Transmission

Biological Transmission This involves the pathogen's

development or multiplication within the vector before transmission: For example, malaria parasites develop within *Anopheles* mosquitoes. The vector becomes infectious after an incubation period.

Mechanical Transmission The pathogen is physically transferred via contaminated mouthparts or body parts. Less common in disease transmission but relevant in certain contexts like fly-borne infections.

Factors Influencing Transmission Vector density and behavior Pathogen infectivity Human-vector contact rates Environmental conditions (temperature, humidity)

Understanding these mechanisms aids in designing effective control and intervention strategies.

Diseases Associated with Arthropod Vectors

Malaria Caused by *Plasmodium* spp., transmitted by *Anopheles* mosquitoes. Symptoms: Fever, chills, anemia. Control: Mosquito nets, antimalarial drugs, vector control.

Dengue and Zika Virus Transmitted primarily by *Aedes aegypti*. Dengue: Severe flu-like illness, potential hemorrhagic fever. Zika: Associated with congenital abnormalities. Control: Eliminating breeding sites, insecticides.

Yellow Fever Transmitted by *Aedes aegypti*. Vaccination is effective. Outbreaks often linked to urbanization and vector proliferation.

Chagas Disease Caused by *Trypanosoma cruzi*, transmitted by triatomine bugs (kissing bugs). Chronic cardiac and gastrointestinal complications.

Filariasis Caused by filarial worms (*Wuchereria bancrofti*, *Brugia malayi*), transmitted by *Culex*, *Anopheles*, and *Aedes* mosquitoes. Leads to lymphatic obstruction and elephantiasis.

Lyme Disease Caused by *Borrelia burgdorferi*, transmitted by *Ixodes* ticks. Symptoms: Erythema migrans rash, joint pain.

Surveillance and Control in Medical Entomology

Importance of Surveillance Monitoring vector populations and pathogen prevalence. Early detection of outbreaks. Assessing effectiveness of control measures.

Methods of Surveillance Mosquito trapping: Light traps, gravid traps, human landing catches. Larval surveys: Identifying breeding sites. Disease incidence monitoring: Epidemiological data analysis.

Control Strategies Source reduction: Removing breeding sites (stagnant water, trash). Chemical control: Insecticides, larvicides. Biological control: Use of predators, pathogens, or sterile insect techniques. Personal protection: Insect repellent, protective clothing, bed nets.
