Overview of Fetal Pig Development Fetal pigs develop within the mother pig's uterus and are typically examined at various stages of gestation, often around 50 to 100 days of development. The external and internal structures are well-developed enough to study, yet still retain features that highlight the developmental process.

Key Features of Fetal Pig Development External features such as limbs, tail, and snout become more defined. Internal organs are proportionally similar to adult pigs but less developed. The umbilical cord connects the fetus to the placenta, facilitating nutrient transfer.

External Anatomy of the Fetal Pig Understanding external features is crucial for orienting oneself during dissection and identifying internal structures.

External Features to Recognize

- Head:** Contains facial features like the snout, eyes, ears, and mouth.
- Limbs:** Forelimbs and hindlimbs that are proportionally smaller but identifiable.
- Tail:** Small and often curled at the posterior end.
