1. Understand the Problem Thoroughly Read the problem carefully, ensuring clarity on inputs, outputs, and constraints. Clarify ambiguous points, asking questions if possible. Restate the problem in your own words to confirm understanding.
2. Devise a Plan Identify the type of problem (e.g., sorting, searching, optimization). Recall relevant algorithms or data structures. Consider constraints to determine the feasible approach. Sketch out pseudocode or diagrams to visualize the solution.
3. Execute the Solution Write clean, modular code based on the plan. Prioritize correctness first; optimize later. Use test cases to verify correctness.
4. Optimize and Refine Analyze time and space complexity. Identify bottlenecks or redundant operations. Consider alternative algorithms for better efficiency. Practice code refactoring for clarity and performance.

Common Algorithmic Problems and Aziz's Solutions To illustrate Aziz's methodology, let's explore some typical interview problems and the solutions approach he advocates.

Problem 1: Find the kth Largest Element in an Array Approach: Use a min-heap of size k to track the k largest elements efficiently. Alternatively, apply the Quickselect algorithm, which partitions the array similarly to Quicksort, to find the kth largest with average linear time.

Steps: Check input constraints. Choose the appropriate method based on data size. Implement the algorithm, ensuring correct handling of edge cases.

Optimization tips: Use built-in heap libraries for simplicity. For large datasets, Quickselect offers better average performance.

Problem 2: Detect a Cycle in a Graph Approach: Use Depth-First Search (DFS) with recursion or a visited states array. Maintain a recursion stack to detect back edges, which indicate cycles.

Steps: Represent the graph using adjacency lists. Perform DFS from each unvisited node. During DFS, mark nodes as visited and part of the recursion stack. If a node is encountered that is already in the recursion stack, a cycle exists.

Optimization tips: Use iterative DFS if recursion depth is a concern. For directed vs. undirected graphs, adapt cycle detection accordingly.

4. Mathematical Algorithms Prime number generation (Sieve of Eratosthenes) Greatest Common Divisor (Euclidean algorithm) Modular arithmetic

Preparing for the Interview: Practice and Mastery Aziz's methodology emphasizes consistent practice and problem exposure.

Practice Strategies: Solve problems across diverse categories to build versatility. Analyze each problem's solution to understand why certain algorithms work. Time your problem-solving to simulate real interview conditions. Review and refactor solutions to improve clarity and performance.
